

## nag\_bessel\_j1 (s17afc)

### 1. Purpose

`nag_bessel_j1` (s17afc) returns the value of the Bessel function  $J_1(x)$ .

### 2. Specification

```
#include <nag.h>
#include <nags.h>
```

```
double nag_bessel_j1(double x, NagError *fail)
```

### 3. Description

This function evaluates an approximation to the Bessel function of the first kind  $J_1(x)$ .

The function is based on Chebyshev expansions.

For  $x$  near zero,  $J_1(x) \simeq x/2$ . This approximation is used when  $x$  is sufficiently small for the result to be correct to **machine precision**.

For very large  $x$ , it becomes impossible to provide results with any reasonable accuracy (see Section 6.1), hence the function fails. Such arguments contain insufficient information to determine the phase of oscillation of  $J_1(x)$ ; only the amplitude,  $\sqrt{2/\pi|x|}$ , can be determined. The range for which this occurs is roughly related to the **machine precision**.

### 4. Parameters

**x**

Input: the argument  $x$  of the function.

**fail**

The NAG error parameter, see the Essential Introduction to the NAG C Library.

### 5. Error Indications and Warnings

**NE\_REAL\_ARG\_GT**

On entry, **x** must not be greater than *value*: **x** = *value*.

**x** is too large. The function returns the amplitude of the  $J_1$  oscillation,  $\sqrt{2/\pi|x|}$ .

### 6. Further Comments

#### 6.1. Accuracy

Let  $\delta$  be the relative error in the argument and  $E$  be the absolute error in the result. (Since  $J_1(x)$  oscillates about zero, absolute error and not relative error is significant.)

If  $\delta$  is somewhat larger than **machine precision** (e.g. if  $\delta$  is due to data errors etc.), then  $E$  and  $\delta$  are approximately related by  $E \simeq |xJ_0(x) - J_1(x)|\delta$  (provided  $E$  is also within machine bounds).

However, if  $\delta$  is of the same order as **machine precision**, then rounding errors could make  $E$  slightly larger than the above relation predicts.

For very large  $x$ , the above relation ceases to apply. In this region,  $J_1(x) \simeq \sqrt{2/\pi|x|} \cos(x - 3\pi/4)$ . The amplitude  $\sqrt{2/\pi|x|}$  can be calculated with reasonable accuracy for all  $x$ , but  $\cos(x - 3\pi/4)$  cannot. If  $x - 3\pi/4$  is written as  $2N\pi + \theta$  where  $N$  is an integer and  $0 \leq \theta < 2\pi$ , then  $\cos(x - 3\pi/4)$  is determined by  $\theta$  only. If  $x \gtrsim \delta^{-1}$ ,  $\theta$  cannot be determined with any accuracy at all. Thus if  $x$  is greater than, or of the order of, **machine precision**, it is impossible to calculate the phase of  $J_1(x)$  and the function must fail.

**8. Example**

The following program reads values of the argument  $x$  from a file, evaluates the function at each value of  $x$  and prints the results.

**8.1. Program Text**

```

/* nag_bessel_j1(s17afc) Example Program
 *
 * Copyright 1990 Numerical Algorithms Group.
 *
 * Mark 2 revised, 1992.
 */

#include <nag.h>
#include <stdio.h>
#include <nag_stdlib.h>
#include <nags.h>

main()
{
    double x, y;

    /* Skip heading in data file */
    Vscanf("%*[^\\n]");
    Vprintf("s17afc Example Program Results\\n");
    Vprintf("      x          y\\n");
    while (scanf("%lf", &x) != EOF)
    {
        y = s17afc(x, NAGERR_DEFAULT);
        Vprintf("%12.3e%12.3e\\n", x, y);
    }
    exit(EXIT_SUCCESS);
}

```
