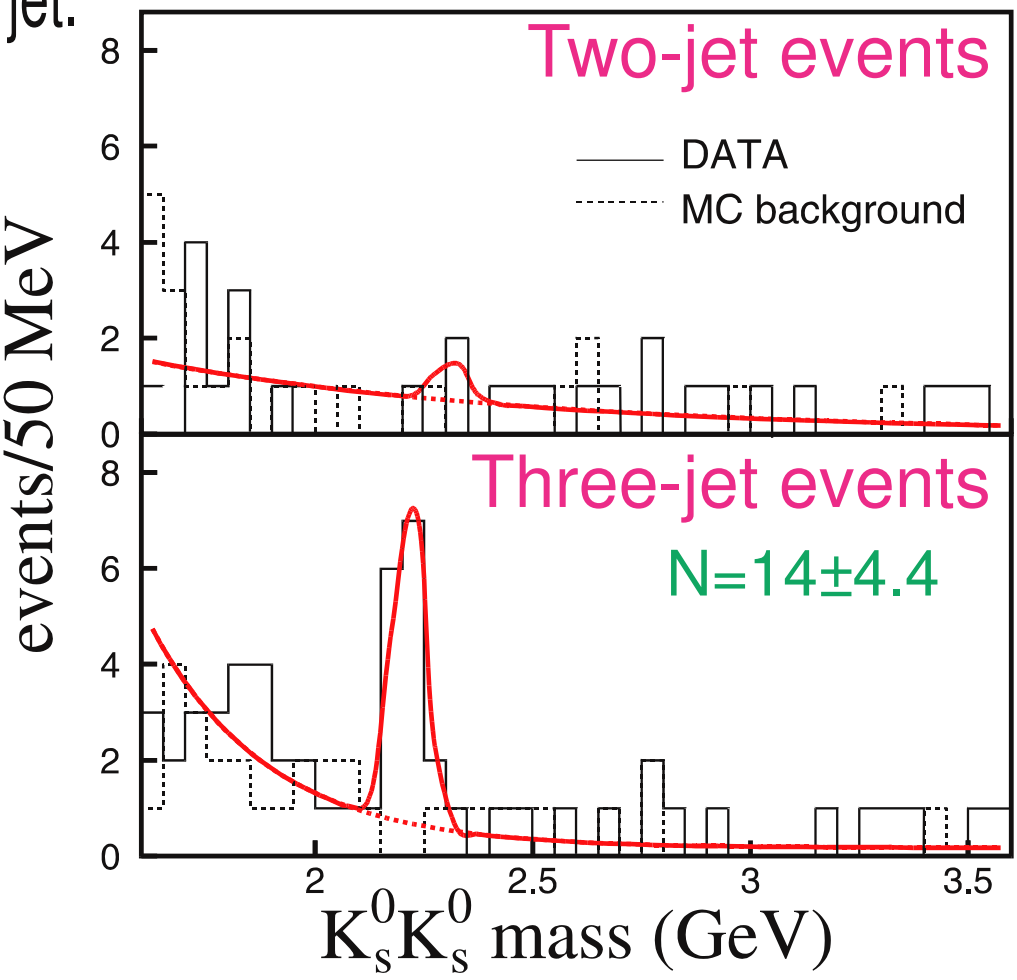
VALIDITY TEST

The signal is found with others drastically different procedures of selection for K_s pairs: Here, cuts are relaxed (Dflight> 1cm, P_t track>0.4 GeV) But we looks only in low multiplicity jets (<7 tracks in the central region) and all tracks are associated to the same jet.



The same effect is found

NB: To look in low multiplicity jets implies a smaller combinatorial background and implicitely favours the less energetic jets!
